

MOCK PITCH · KELLOGG'S CIO

Scaling what's working.

Databricks alongside your PI System.

A conversation about how Kellogg's can get even more out of the data PI is already collecting — starting at Battle Creek, then scaling to all 50 sites.

databricks

OUR UNDERSTANDING

Here's the Kellogg's landscape as I see it.

Please correct us where we're wrong — this shapes everything that follows.

OPERATIONAL BACKBONE

AVEVA PI System across the estate

The system of record for time-series operational data.

FOOTPRINT

~50 manufacturing sites worldwide

Battle Creek is the proving ground.

PROVEN OUTCOME

\$3.3M annual savings, one site

Kellogg's already turns operational data into financial outcomes.

PUBLIC COMMITMENTS

2030 and 2050 sustainability targets

Energy, water and Scope 1–3 emissions, publicly measured.

THE OPPORTUNITY

PI proved the model at one site. Databricks scales it across 50.

WHAT PI DELIVERED

\$3.3M

annual energy savings at Battle Creek.

A real result from PI doing exactly what it was built for.

Source: AVEVA, Kellogg's case study

WHERE DATABRICKS TAKES IT

Scale that result. Then go beyond it.

Battle Creek is the floor, not the ceiling. Databricks lets Kellogg's apply the same data-driven approach across all 50 sites — and unlock things PI alone wasn't built for: enterprise-wide AI, IT/OT data joined together, and live data sharing with partners and regulators.

HOW IT FITS TOGETHER

PI stays where it is. Databricks sits alongside.

Kellogg's keeps PI doing what it's good at. Databricks plugs in next to it and adds the analytics, AI and sharing capabilities PI was never designed for.

INTEGRATION

AVEVA CONNECT

native Databricks integration

Streams PI tag values and AF context to the Lakehouse — no rip-and-replace.

Streaming + batch · governed

DATABRICKS LAKEHOUSE

Databricks Lakehouse

Unity Catalog · Delta Lake · governed

Bronze

Raw PI tags + IT sources

Silver

Cleaned, joined, contextualised

Gold

ML features · KPIs · shared

→ BI · ML models · Delta Sharing to partners

CAPABILITY 1 OF 3

Real-time analytics & streaming

THE CAPABILITY

Streaming and batch in one engine.

The same pipeline handles live PI tag data and historical replays — acting on it as it lands, not the next morning.

AT KELLOGG'S

Line-level OEE in real time, not in tomorrow's report.

Today, PI surfaces what happened on the cereal line. Streaming the same tags into Databricks means a downtime event triggers a model the moment it starts — not after the shift ends.

10–15% *operational efficiency uplift — manufacturing average across Databricks customers*

Source: Xorbix industry report, 2025

CAPABILITY 2 OF 3

Time-series analytics

THE CAPABILITY

From historian to forecaster.

PI records what happened. Databricks uses that history to predict what's about to happen — energy, yield, equipment failures.

AT KELLOGG'S

Predictive maintenance on extruders, ovens and packaging lines.

Vibration, temperature and motor-current tags from PI become training data for failure-prediction models — moving Kellogg's from scheduled maintenance to condition-based maintenance.

20–30%

maintenance cost reduction — predictive maintenance benchmark, manufacturing

Source: Xorbix industry report, 2025

CAPABILITY 3 OF 3

Delta Sharing & Unity Catalogue

THE CAPABILITY

Share live data, not file dumps. Governance.

Partners and regulators read live tables directly — governed at the column level. This is the thing PI alone simply can't do.

AT KELLOGG'S

Sustainability reporting that doesn't require an army.

Share live Scope 1–3 emissions data and energy usage with auditors, retailers (Walmart, Tesco) and regulators directly — no quarterly spreadsheet exports, no version mismatches, no rework.

Direct line

to 2030 and 2050 sustainability commitments — already public, already measured

CASE STUDY

BP unified OT and IT data alongside its existing systems.

THE STARTING POINT

Operational data, fragmented

BP's data lived across refineries, trading desks and corporate systems — rich, but siloed. Engineers spent more time stitching data together than analysing it.

WHAT THEY DID

Built the Unified Data Experience on Databricks

Kept their existing systems in place. Used Databricks as the platform to unify, govern (Unity Catalog) and serve data to the people who needed it.

THE IMPACT

25% productivity boost

Decentralised data ownership, faster discovery, optimised compute costs, consistent quality — and a single portal for the enterprise to find and use data.

Source: Databricks BP customer story, databricks.com/customers

Why it applies to Kellogg's:

BP had refineries, historians and global operations. Kellogg's has plants, PI and 50 sites. Same pattern — keep what works, add intelligence on top.

WHERE WE'D LIKE TO GO NEXT

Three concrete steps.

01

THIS QUARTER

Engage your business stakeholder for a business demo

A working session with the people who'll actually use this — operations, sustainability and supply chain leads. Real Kellogg's questions, real Databricks answers.

02

NEXT QUARTER

Workshop — today's architecture vs future architecture for Kellogg's

Half-day with your data, OT and plant engineering leads. Current state mapped against target state. Output: a one-page reference architecture for Kellogg's.

03

ONGOING

Invitation to Databricks Data + AI Summit

Our flagship annual event in San Francisco. Manufacturing track, peer conversations with companies like BP, and hands-on sessions on the capabilities discussed today.

Thank you. Questions welcome.
